1 Introduction

Lorem Ipsum [?]

2 Algorithm

In this chapter, we describe the distributed algorithm that computes the assumption function \mathcal{A} .

2.1 Distributed Environment

In this section, we briefly describe the distributed environment assumed by our algorithm, in order to prevent any possible confusion.

We assume a distributed environment with fixed number of reliable processes connected by reliable, order-preserving channels (The order preservation can be relaxed to some extent). We also assume that each process has a fixed identifier and the set of all process identifiers is equal to the result set of the partition function. Each process can communicate directly (using the function `SEND`) with any other process (assuming it knows other process's identifier) and all messages that can't be processed directly are stored in a queue until they can be processed.

Several parts of the algorithm do not have explicit termination (they terminate by reaching deadlock - no messages are exchanged between processes). In such cases, suitable termination detection algorithm is employed to detect this deadlock and terminate computation properly. Our implementation uses Safra's algorithm [CITATION] for this purpose, but the related code has been skipped for easier readability.

We also divide algorithm description into three main parts: Process variables, Initialization and Message handler. First section describes data structures stored in process memory available during whole computation. Initialization section is executed exactly once and no messages can be received until it's finished. Message handler defines what should happen when message is received.

2.2 Algorithm outline

The main idea of the algorithm is described in REFERENCE and resembles other CTL model checking algorithms.

```

1: procedure CHECKCTL( $\phi, \mathcal{K} = (id, f, \mathcal{P}, S, I, \xrightarrow{p}, L)$ )
2:    $\mathcal{A} \leftarrow \{(p, s, \alpha, \text{tt}) \mid p \in \mathcal{P} \wedge \alpha \in L(s)\}$ 
3:   for all  $i < |\phi|$  do
4:     for all  $\psi$  in  $cl(\phi)$  where  $|\psi| = i$  do
5:        $\mathcal{A} \leftarrow \text{CHECKFORMULA}(\psi, \mathcal{K}, \mathcal{A})$ 
6:     end for
7:   end for
8: end procedure

```

The algorithm starts by initializing the assumption function using the labeling function defined in kripke fragment. After that, it traverses the structure of formula, starting from smallest formulas and uses computed results to process more complex formulas. Function CHECKFORMULA computes all states and colors where formula ψ holds and returns assumption function updated accordingly. This is done using the local information contained in given kripke fragment, assumptions previously computed for smaller formulas and also by communicating with other processes. Note that only assumptions relevant for particular process are computed and returned (each process has information only about it's own state space).

2.3 Common operations

In this section, we define functions used to simplify the algorithm description. Let us fix a formula ϕ and a parametrised kripke fragment $\mathcal{K} = (id, f, \mathcal{P}, S, I, \xrightarrow{p}, L)$ as input of the algorithm.

Intuitively, function $validStates : cl(\phi) \times AS_{\mathcal{K}}^{\phi} \rightarrow S \times 2^{\mathcal{P}}$ computes a set of states and parameters where truth of given formula is assumed. It is also responsible for handling of boolean operators, since these can be computed without any inter-process communication.

$$validStates(\phi_1 \wedge \phi_2, \mathcal{A}) = \{(s, p) \mid \mathcal{A}(s, p, \phi_1) = \text{tt} \wedge \mathcal{A}(s, p, \phi_2) = \text{tt}\}$$

$$validStates(\phi_1 \vee \phi_2, \mathcal{A}) = \{(s, p) \mid \mathcal{A}(s, p, \phi_1) = \text{tt} \vee \mathcal{A}(s, p, \phi_2) = \text{tt}\}$$

$$validStates(\neg\phi, \mathcal{A}) = \{(s, p) \mid \mathcal{A}(s, p, \phi) = \text{ff}\}$$

$$validStates(\phi, \mathcal{A}) = \{(s, p) \mid \mathcal{A}(s, p, \phi) = \text{tt}\}$$

Function *predecessors* : $S \rightarrow S \times 2^{\mathcal{P}}$ computes set of direct predecessors of given node including the color sets labeling the appropriate transitions.

$$predecessors(to) = \{(from, P) \mid P = \{p \mid from \xrightarrow{p} to\}\}$$

Symmetrically, function *successors* : $S \rightarrow S \times 2^{\mathcal{P}}$ computes set of direct successors of given node including the color sets labeling the appropriate transitions.

$$predecessors(from) = \{(to, P) \mid P = \{p \mid from \xrightarrow{p} to\}\}$$

2.4 Temporal Operators

In this section, we describe how the CHECKFORMULA is implemented for each of the temporal operators. Note that all of the following algorithms has implicit termination and therefore needs a proper termination detection algorithm to correctly terminate.

2.4.1 Exist Next Operator

```

1: Process variables:
2:  $\mathcal{K} = (id, f, \mathcal{P}, S, I, \xrightarrow{p}, L)$  ▷ Kripke fragment
3:  $\phi = \text{EX}\phi_1$  ▷ CTL formula
4:  $\mathcal{A}$  ▷ Initial assumption function
5: procedure INIT
6:   for all  $(state, colSet)$  in  $validStates(\phi_1, \mathcal{A}, \mathcal{K})$  do
7:     for all  $(pred, tranCol)$  in  $predecessors(state, \mathcal{K})$  do
8:        $\text{SEND}(f(state), (pred, colSet \cup tranCol))$ 
9:     end for
10:  end for
11: end procedure
12: procedure RECEIVE( $colSet, to$ )
13:   $\mathcal{A} \leftarrow \mathcal{A} \cup \{(p, to, \phi, \text{tt}) \mid p \in colSet\}$ 

```

14: **end procedure**

The simplest of temporal operators is the EX operator. During initialization, all states and colors where ϕ holds

2.4.2 Exist Until Operator

```

1: Process variables:
2:  $\mathcal{K} = (id, f, \mathcal{P}, S, I, \xrightarrow{p}, L)$  ▷ Kripke fragment
3:  $\phi = E\phi_1 U \phi_2$  ▷ CTL formula
4:  $\mathcal{A}$  ▷ Initial assumption function
5: procedure INIT
6:   for all state in validStates( $\phi_2, \mathcal{A}, \mathcal{K}$ ) do
7:      $\mathcal{A} \leftarrow \mathcal{A} \cup (\mathcal{P}, state, \phi)$ 
8:     for all (pred, tranCol) in predecessors(state,  $\mathcal{K}$ ) do
9:       SEND(f(state), (state, pred,  $\mathcal{P} \cup tranCol$ ))
10:    end for
11:  end for
12: end procedure
13: procedure RECEIVE(colSet, from, to)
14:    $colSet \leftarrow colSet \cap valid(\phi_1, to, \mathcal{A})$ 
15:   if  $colSet \neq \emptyset$  and  $colSet \setminus valid(\phi, to, \mathcal{A}) \neq \emptyset$  then
16:      $\mathcal{A} \leftarrow \mathcal{A} \cup (colSat, to, \phi)$ 
17:     for all (pred, tranCol) in predecessors(to,  $\mathcal{K}$ ) do
18:       SEND(f(pred), (to, pred,  $colSat \cup tranCol$ ))
19:     end for
20:   end if
21: end procedure

```

2.5 All Until Operator

```

1: Process variables:
2:  $\mathcal{K} = (id, f, \mathcal{P}, S, I, \xrightarrow{p}, L)$  ▷ Kripke fragment
3:  $\phi = A\phi_1 U \phi_2$  ▷ CTL formula
4:  $S = \emptyset$ 
5:  $\mathcal{A}$  ▷ Initial assumption function
6: procedure INIT
7:   for all state in validStates( $\phi_2, \mathcal{K}$ ) do

```

```
8:      for all ( $pred, tranCol$ ) in  $predecessors(state, \mathcal{K})$  do
9:          SEND( $f(state), (state, pred, \mathcal{P} \cup tranCol)$ )
10:      end for
11:  end for
12: end procedure
13: procedure RECEIVE( $colSet, from, to$ )
14:      $S \leftarrow S \cup (to, from, colSet)$ 
15:      $colSet \leftarrow colSet \cap valid(\phi_1, to, \mathcal{K})$ 
16:     if  $colSet \neq \emptyset$  and  $colSet \setminus valid(\phi, to, \mathcal{K}) \neq \emptyset$  then
17:          $\mathcal{A} \leftarrow \mathcal{A} \cup (colSat, to, \phi)$ 
18:         for all ( $pred, tranCol$ ) in  $predecessors(to, \mathcal{K})$  do
19:             SEND( $f(pred), (to, pred, colSat \cup tranCol)$ )
20:         end for
21:     end if
22: end procedure
```

A First appendix

Hello, here is some text without a meaning. This text should show what a printed text will look like at this place. If you read this text, you will get no information. Really? Is there no information? Is there a difference between this text and some nonsense like “Huardest gefburn”? Kjift – not at all! A blind text like this gives you information about the selected font, how the letters are written and an impression of the look. This text should contain all letters of the alphabet and it should be written in of the original language. There is no need for special content, but the length of words should match the language.

This is the second paragraph. Hello, here is some text without a meaning. This text should show what a printed text will look like at this place. If you read this text, you will get no information. Really? Is there no information? Is there a difference between this text and some nonsense like “Huardest gefburn”? Kjift – not at all! A blind text like this gives you information about the selected font, how the letters are written and an impression of the look. This text should contain all letters of the alphabet and it should be written in of the original language. There is no need for special content, but the length of words should match the language.

And after the second paragraph follows the third paragraph. Hello, here is some text without a meaning. This text should show what a printed text will look like at this place. If you read this text, you will get no information. Really? Is there no information? Is there a difference between this text and some nonsense like “Huardest gefburn”? Kjift – not at all! A blind text like this gives you information about the selected font, how the letters are written and an impression of the look. This text should contain all letters of the alphabet and it should be written in of the original language. There is no need for special content, but the length of words should match the language.

After this fourth paragraph, we start a new paragraph sequence. Hello, here is some text without a meaning. This text should show what a printed text will look like at this place. If you read this text, you will get no information. Really? Is there no information? Is there a difference between this text and some nonsense like “Huardest gefburn”? Kjift – not at all! A blind text like this gives you information

about the selected font, how the letters are written and an impression of the look. This text should contain all letters of the alphabet and it should be written in of the original language. There is no need for special content, but the length of words should match the language.

Hello, here is some text without a meaning. This text should show what a printed text will look like at this place. If you read this text, you will get no information. Really? Is there no information? Is there a difference between this text and some nonsense like “Huardest gef-burn”? Kjift – not at all! A blind text like this gives you information about the selected font, how the letters are written and an impression of the look. This text should contain all letters of the alphabet and it should be written in of the original language. There is no need for special content, but the length of words should match the language.
